

# Camera controls

F1: Follow Camera

F2: Free Camera

F3: Flyby Camera

F4: Smooth Follow Camera

## All Cameras

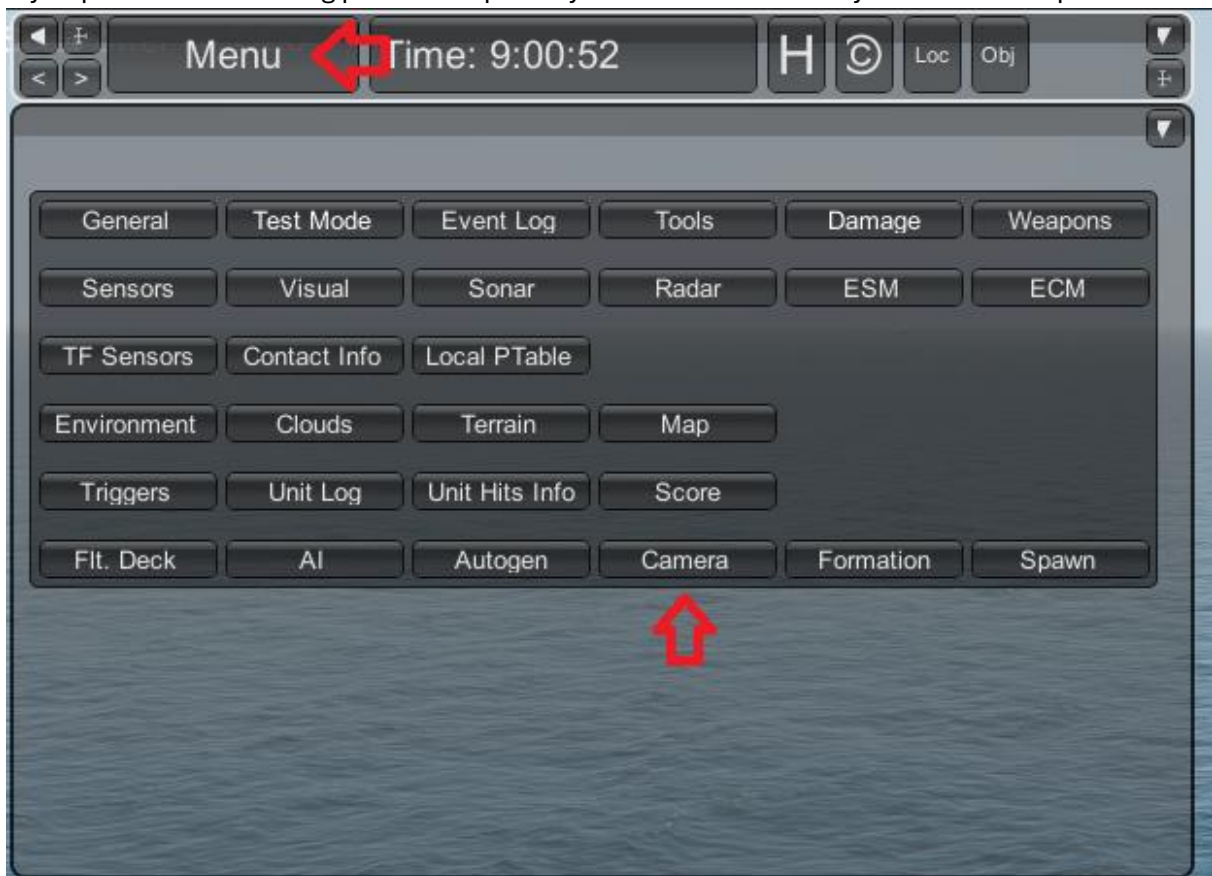

- Shift + mouse wheel will zoom faster
- Ctrl + Mouse wheel will zoom slower
- Alt + mouse wheel will override the FOV settings and disables the normal zoom
- Alt + middle mouse button will reset the FOV
- Alpha (num pad) +/- changes the FOV (+ Shift boosts it)

There is a camera.ini file under:

Sea Power\_Data/StreamingAssets/original/

This file contains several useful settings.

If you press F10 our debug panel will open. If you click on “General” you will see all options:

Select camera and you have some more options for the cameras. Most of those things are also available via hot keys:

Ensure that Additional Controls is enabled for some of the features below (e.g. cinematic cam)

## F1: Follow Camera

The follow camera will always stick to the currently selected object.

Possible controls:

- Left mouse button + mouse move will rotate the camera around the object
- Shift + Right mouse button + mouse move will rotate the camera around itself (secondary rotation)
- Shift + WASDRF will move the camera like in 1<sup>st</sup> person games while it's still bound to the selected object (secondary translation)
- Shift + Middle mouse button will reset the secondary rotation and translation
- Mouse wheel will zoom in/out unless the secondary rotation/translation was used
- If you have moved the camera to some interesting location you can press Shift + L to stick it to that location. Might be useful if you want to “glue” it on a wing for an aircraft to follow its movements
- Z + Left mouse button plus moving will roll the camera
- Shift + Z will reset that rolling/banking

## F2: Free Camera

The free camera can be moved everywhere.

Possible controls:

- Left mouse button + mouse move will rotate the camera around the object
- Mouse wheel will zoom in/out

## F3: Flyby Camera

The flyby camera will stay on a fixed position towards the direction of the selected object and keep looking at it while it passes by.

You can also set a preset position for the flyby camera. To do so:

- select the object you want to follow
- press F2 to get to the free camera
- position the camera where it should stay
- press Alt+S to save the position
- switch to Flyby Cam with F3

Possible controls:

- Mouse wheel will zoom in/out

## F4: Smooth Follow Camera

The smooth follow camera will always stick to the currently selected object in a “smoother” follow way. It will also bank the camera together with the attached object which is mainly useful for aircraft.

You can change this behavior in the camera.ini in this section:

```
[FollowCam]
# The following parameters are for the smooth follow mode (F4)
# If enabled it means that the camera would only start to roll/bank if the
# cam is looking from an area of x degrees front/back-end
# meaning when the cam looks from the side it won't bank if an aircraft turns
# but it would if the cam looks from the front or from behind in that angle range
FadeInBankingEnabled=True
FadeInBankingCamAngle=20
SecondaryTranslationSpeed=0.2
```

Possible controls:

- Left mouse button + mouse move will rotate the camera around the object
- Shift + Right mouse button + mouse move will rotate the camera around itself (secondary rotation)
- Shift + WASDRF will move the camera like in 1<sup>st</sup> person games while it's still bound to the selected object (secondary translation)
- Shift + Middle mouse button will reset the secondary rotation and translation
- Mouse wheel will zoom in/out unless the secondary rotation/translation was used

- If you have moved the camera to some interesting location you can press Shift + L to stick it to that location. Might be useful if you want to “glue” it on a wing for an aircraft to follow its movements

## Cinematic Cameras

There are some cinematic camera moves available, you can change the details in the DM panel. If you found some good settings you can toggle the different modes using those hot keys:

|                                        |          |
|----------------------------------------|----------|
| Enable/Disable                         | Shift+F1 |
| Reset position                         | Shift+F2 |
| Enable/Disable Left/Right rotation     | Shift+F3 |
| Change Left/Right rotation direction   | Ctrl+F3  |
| Enable/Disable Up/Down rotation        | Shift+F4 |
| Change Up/Down rotation direction      | Ctrl+F4  |
| Move towards/away to/from object       | Shift+F5 |
| Change move direction (towards/away)   | Ctrl+F5  |
| Enable/Disable sine move with rotation | Shift+F6 |
