

How to create a new localization for Sea Power

This document describes how a new language can be added to the game Sea Power and which files are affected.

Introduction

All original main language resources can be found under:

```
steamapps\common\Sea Power\Sea  
Power_Data\StreamingAssets\original\language_xx
```

There are additional resources for the missions and campaigns under

```
steamapps\common\Sea Power\Sea Power_Data\StreamingAssets\original\missions  
  
and
```

```
steamapps\common\Sea Power\Sea  
Power_Data\StreamingAssets\original\campaigns
```

Please note: You should **never** add or modify files in the original data folder! While it works it's a bad practice and interferes with other mods and changes we as developers do. Instead, please use the user folder (StreamingAssets\user) where you can mirror the folder structure. The game will always look for files in the user folder first as a potential override for the original ones and use them when there are any.

Also as Sea Power has still lots of moving parts you should monitor changes and update your language resource files as well regularly, otherwise it might happen that people see lots of "MISSING TEXT" labels in the game.

Creating a new language structure

- Go to StreamingAssets\original\ and copy the language_en folder and optionally the missions folder and the campaigns folder to StreamingAssets\user\
 - Rename that language_en folder to the language you want to create, e.g. StreamingAssets\user\language_gr
- Now to let the game know there is a new language copy the file StreamingAssets\original\config.ini to StreamingAssets\user\ and open it in a text editor. Look for the section [languages] and add your language there
- When you start the game you already should see that new language in the options menu for the language selection. Also switching to it should work already even though it will just show the English original

Translating the main language files

Now the big chunk of work starts. Go through all files in your language folder and translate the values. Never translation sections (which are within brackets, e.g. `[General]`) and never translate keys which are on the left side before the “=”.

Translating the missions

You can also optionally translate all or some of the missions. The following steps must be done (remember, do **not** edit the files in the `original` folder!):

- Go to the `missions` folder and enter the subfolder of the missions you want to edit. Open the `_info.ini` file. Add your language section there.
- Open the mission file you want to translate and duplicate the `language_en` section in the same file and rename it to your language. Then work through all values. Again, do not translate the keys (before the “=”)!
- Some of the missions have folders for additional resources. You can also translate the `BriefingMap_en.xml` and `BriefingText_en.xml`. Please again copy the English originals and use them as reference. As those files are xml files (which allow layouting) they are a bit harder to translate but you will make it! 😊

Some word about layouts: Those XML files basically mirror what WPF does on Windows. For a good reference look here: [LINK TO WPF/NOESIS](#)

To edit those xml files we recommend using Visual Studio (which is free as the community edition).

Translating the campaigns

Like the missions you can also optionally translate the campaigns. Currently there is only one linear campaign available. Later on, when the dynamic campaign is there this document will be updated. The following steps are necessary:

- Go to the `campaigns` folder and enter the subfolder of the campaign you want to edit. Open the `campaign.ini` file and add your language section there.
- Please note that this `campaign.ini` also contains more references to the missions and files to use. Do a search for `Name_en=` in that file and duplicate those as well and refer to the correct xml files (and of course rename the suffix of that key to your language, e.g. `Name_gr=`).
- Open the `missions` subfolder and work through the files as described above for the missions.
- Additionally to the missions you see there is also an art folder. In this folder you find the files which are referenced in the `campaign.ini`. Duplicate the original `complete_event_xy.xml` files (where xy is a number!) and add your language extension to it and translate the parts which need translation. Same is true for

the `free_event_xy.xml` files. Those files also support embedded pictures, so you can add your localized pictures there too if needed. For layout options of that descriptive XML format please refer to the link above under the missions section in this document.

Wrap up

Congratulations! You should now have a working new language!
